

Lecture – 3.4

JAVA: Scanner Class

Afsara Tasneem Misha

Lecturer

Department of CSE

Daffodil International University

Today's Topics

- Taking input using Scanner class
- Some exercises using scanner class

Taking input from User

Scanner Class

- '**Scanner**' class is used to take **input from user**
- An **object** of **Scanner** class is created to read input
- Java uses **System.out** to refer to the **standard output** device and **System.in** to **standard input** device
- Import '**java.util.Scanner**' package to use scanner class

Commonly used methods for Scanner class

- **nextByte():** reads an **Byte** value from the user
- **nextShort() :** reads an **Short** value from the user
- **nextInt() :** reads an **int** value from the user
- **nextLong() :** reads an **Long Integer** value from the user
- **nextFloat() :** reads an **Float** value from the user
- **nextDouble() :** reads an **Double** value from the user
- **next() :** reads a word from the user
- **nextLine() :** reads a **Line of Text** from the user

Exercise

Using Scanner class

- Take two integer numbers as input and calculate their sum.
- Calculate the area of a circle. Take radius as input.
- Take some information about yourself (i.e. name, age, cgpa, department, section etc) as input and display them.

```
import java.util.Scanner;

public class AddTwoInt {

    public static void main(String[] args)
    {

        Scanner input = new Scanner(System.in);

        System.out.println("Enter first number: ");

        int a = input.nextInt();

        System.out.println("Enter second number: ");

        int b = input.nextInt();

        System.out.println("The sum of two numbers: "+(a+b));

    }

}
```

1.import java.util.*;

2.public class ScannerExample {

3.public static void main(String args[]){

4. Scanner in = **new** Scanner(System.in);

5. System.out.print("Enter your name: ");

6. String name = in.nextLine();

7. System.out.println("Name is: " + name);

8. }

9. }

Thank You
